

LEARNMATE

Project Demo Planning

Field	Details
Date	To be confirmed
Team ID	To be filled by the team
Project Name	Learnmate
Maximum Marks	1 Mark (as stated in the supplied template)

Project Demo Planning

This plan outlines a proposed demonstration flow for Learnmate based on the supplied backend code screenshots. It covers the project introduction, backend solution overview, authentication and access control, study-material and upload workflow, AI integration, and questions. The complete frontend and live application behavior were not included in the supplied screenshots, so the demo should use the actual available interface or Postman collection and be updated to match the final build.

The durations and responsibilities below are suggested. Replace role labels with the actual team members and adjust the sequence to match the working application. Demonstrate only features that have been tested successfully.

S.No	Demo Section	Description	Duration (mins)	Responsible Member
1	Introduction & problem statement	Introduce Learnmate and explain the study-support need it is intended to address. State the project scope and what will be shown in the demo.	1	Presenter / Team Lead
2	Solution overview & architecture	Show the project structure and explain the Node.js/Express API, MongoDB with Mongoose, route-controller organization, and Gemini integration visible in the code.	1.5	Backend Developer
3	Authentication & role access	If working in the demo environment, show the authentication flow and explain JWT Bearer-token verification and student/admin roles. Avoid displaying real passwords or secrets.	1	Backend / Authentication Developer
4	Study material & file upload	Demonstrate the available material workflow using a supported .txt, .md, or .pdf file within the 5 MB limit. Explain the Material fields shown in the model.	2	Material Module Developer
5	AI study support & output	If connected and tested, demonstrate the Gemini-backed study-support output. Explain the intended summary, flashcards, quiz, or study-plan fields; do not present unverified outputs as working features.	1.5	AI Integration Developer
6	Testing summary, limitations & Q&A;	Summarize tested modules, mention any pending items, answer questions, and close the presentation.	1	Presenter / Team Lead

Demo Flow Summary

Step	Activity	Notes
1	Introduction & Problem Statement	State the purpose of Learnmate, the intended users, and the study-support problem addressed. Keep the introduction brief.

Step	Activity	Notes
2	Solution Overview	Explain the high-level architecture: client (if available) → Express API → route/controller modules → MongoDB; show the Gemini utility as the AI integration.
3	Live Feature Demonstration	Run only tested features: authentication, role check, material upload/management, and AI-generated learning support if operational. Use a demo account and sample file.
4	Q&A; Session	Answer questions about the workflow, technologies, security measures visible in the code, current limitations, and planned improvements.

Demo Readiness Checklist

- Application starts and database connection is verified
- Demo account is ready; no real credentials or API keys are shown
- Sample file is supported and within the configured upload limit
- Gemini/API connectivity is tested before the presentation, if AI output will be shown
- Postman collection or frontend is ready for the selected demo steps
- Team members know their speaking and demonstration responsibilities
- Backup screenshots or a short recording are available in case of connectivity issues

Prepared from the user-provided Learnmate code screenshots and the uploaded "Project Demo Planning" template. Confirm actual team roles, date, demo duration, and feature readiness before submission.
